We did a physics lab in class today as a lesson to analyze the potential and kinetic energy of three different balls. For each type of balls (tennis, rubber, superball) , we were given three different heights that the balls are dropped at. We also recorded the time & rebound height of the ball. It ask me to find the initial mechanical energy for each ball at each height & the final mechanical ...

How Does It Work. Let's start with the bubbles you saw forming on the shell. The bubbles are carbon dioxide (CO 2). Vinegar is an acid called acetic acid (CH 3 COOH), and white vinegar from the grocery store is usually about 4% acetic acid and 96% water. Eggshells are made up of calcium carbonate (CaCO 3). The acetic acid in the vinegar reacts with the calcium carbonate in the eggshell to make ...

AP Physics 1: Bouncy Balls My article on this lab is in the Jan 2018 Issue of The Science Teacher. Students wrapped up their video analysis of a bouncy ball's motion and started working on CER statements to answer what interaction dissipates the energy. I ended up doing more coaching than I usually do: I...
