Design Guidelines. Design of a composite structure requires a good knowledge of how composites differ from traditional engineering materials, and what effect those differences have on analysis and manufacturing. Like metal alloys, composites are formed from two or more materials. Unlike metals, the composite constituents remain.

Composite tools, sometimes called soft tooling, are more easily constructed than metal tools and, because they are made from materials similar to those the composite manufacturer will use for the part, they can be made in-house. But as the "soft" designation suggests, they are more vulnerable to wear, and they typically find service in relatively low-volume production.

Design from the composite laminate, not an existing tool, this will aid in reducing excessive bagging area. FDM tooling in general only requires approximately 2-3" beyond the EOP for bagging materials. Shell style tooling minimises material use over sparse style tool designs, particularly when envelope bagging.
