Conservation Of Freshwater Fishes Conservation

Freshwater fish are one of the most diverse groups of vertebrates, but are also amongst the most threatened. With contributions from leaders in the field, this is the first assessment of the global state of freshwater fish diversity, synthesising the opportunities, challenges and barriers facing the conservation of freshwater fish biodiversity.

freshwater fish species, discussing the features of freshwater fish biology and ecology that render so many species vulnerable to extinction. Introductory chapters on why freshwater fish are so sensitive to environmental change and disturbance lead into chapters providing detailed reviews of the key threatening processes and potential solutions.

Although IUCN assessments of the world's threatened and extinct fishes are incomplete they do suggest that documented fish extinctions in the wild are relatively rare, and surprisingly similar in the freshwater and marine realms – 69 freshwater species and 65 marine extinctions at local, regional or global scale (Dulvy et al., 2003; Darwall and Freyhof, 2016). The depressing picture is that a great many more species are threatened with extinction or their status is unknown.

Freshwater ecosystems also provide important services, with one estimate valuing them at US\$4 trillion per year (Costanza et al. 2014). We would expect the conservation of freshwater ecosystems and their species to be a global priority, especially for those countries signed up to the Convention on Biological Diversity and the associated Aichi Targets (Leadley et al., 2014), the Ramsar Convention on Wetlands of International Importance, and the Sustainable Development Goals.

One such option that has potential to protect freshwater ecosystem from numerous threats is the creation of freshwater aquatic sanctuary (FAS) within protected area network. Though similar conservation practices are well established in the terrestrial and marine ecosystem, however, the work on freshwater systems has been very slow and negligible.

Published September 2019. This book is a valuable resource for those involved in conservation of freshwater fishes that seek proactive, integrated, holistic approaches to conservation of freshwater, riparian, and upland habitats. Many case studies from freshwater systems throughout the United States are profiled and they include the implementation of multispecies assessments, conservation area prioritizations, partnership-based conservation planning, and watershed-scale conservation delivery.

Introduction to Freshwater Fishes and Their Conservation

NFCAs were determined based on spatial prioritization algorithms that utilized Species Distribution Models (<http://www.fishesoftexas.org/models/>) for 91 freshwater fishes considered species of greatest conservation need, as well as watershed characteristics and presence of habitat conditions necessary to fulfill their life histories. These NFCAs thus represent “native fish strongholds” and are considered priority landscapes for natural resource conservation investments.

According to Mittermeier et al., 2010, freshwater ecosystems cover an estimated 0.8% of the world's surface, yet support up to 12% of the world's known species. Despite this rich biodiversity, freshwater inhabitants are generally not a conservation priority. Freshwater fishes currently make up nearly one quarter of all ASAP species.

The conservation of freshwater fish: Past and present ...

Amongst the most threatened groups of freshwater species are fish. Of some 15,000 species of freshwater fish approximately one in three are threatened with extinction. Without conservation action it is clear that many of these species will be lost from our planet forever.

Working together to conserve freshwater species - Shoal

Freshwater fish are not the only neglected species. In fact, most conservation attention and funding is given to a very small number of flagship species. However, there is a growing movement pushing for the conservation of the thousands of remaining less-charismatic species.
