Differential Diagnosis.

Alzheimer's disease accounts for up to 80 percent of all dementia cases. Diagnosis may be complicated by other forms of dementia that have symptoms and pathologies similar to Alzheimer's disease.

File Type PDF

Dementia

Presentations

Knowing the key features and pathology of each type of dementia can help in the accurate diagnosis of patients, so they will receive the treatment and support services appropriate for their condition and maintain the highest possible quality of life.

Differentiating

Subtypes of Dementia

The second step in diagnostic decisions is differential diagnosis among the various subtypes of dementia (e.g., Alzheimer disease versus vascular dementia or dementia with Lewy bodies), generally based on whatever typology of biological factors is being used.

Background: Dementia with Lewy bodies is one of the most

prevalent dementia diagnoses. However, differential diagnosis

between dementia with Lewy bodies,

Alzheimer's disease, and Parkinson's

disease with dementia can still be very

difficult given the overlap in

neuropathology,

those of Parkinson's disease. Memory

problems and personality changes may also lead a

physician to mistake PSP for depression, or even attribute

symptoms to some form of dementia.

## **Differential Diagnosis of Dementia**

Delirium (sometimes called 'acute confusional state') is

File Type PDF

Dementia

Presentations

an acute, fluctuating syndrome of disturbed consciousness, attention, cognition, and perception. It is a common condition in the differential diagnosis for dementia.

People with cognitive impairment are at increased risk of delirium, and the two conditions often coexist.
