Most of the electric motor failures occur at the start up. Most of them are caused by the over-heating of motor. There are also other factors which greatly affect the performance of electric motors such as low resistance, dirt, moisture, over-current and vibrations. Electric motors should be installed very carefully and should be looked after at regular intervals.

Stator failures occur due to the rewind burnout of the windings. This often happens before the motor can be rewound requiring emergency repairs. But because the plant will need the motor returned as soon as possible, hasty repairs can end up damaging the stators by improperly heating the housing and the stator. This can also lead to motor inefficiencies.

EXCITER ROTOR REWINDING in Hindi

A generator is mechanically similar to the motor but works in the reverse direction by converting the energy from mechanical to electrical. An electric motor can be built with the rotor, stator, air gap, windings, bearings, & commutator. The classification of motors can be done with considerations like the type of power source, construction ...
