A causal claim is one that asserts that there is a relationship between two events such that one is the effect of the other. A causal claim takes the form of "x causes y," with x referring to the cause and y referring to the effect. A causal argument provides the premises to support a conclusion about a cause and effect relationship.

Making causal claims (ILAC Brief 26) - Changeroo

Non-physical causal claims include claims that are behavioral, psychological, sociological, political or economic. Claims 1 and 2 are physical causal claims. The others are non-physical. The important (general) difference between the two is this: With physical causation the cause (usually) occurs before the effect.

Causal Reasoning 2: Evaluating Causal Claims - Reasoning ...

The first intervention was causal claim alignment. We made suggestions to align the headline and prominent claims with the evidence, such that direct causal claims were only made for experimental evidence, while correlational data carried cautious claims, using words such as might and may. The second intervention was a causality statement/caveat.
