In mathematics, a partial differential equation (PDE) is an equation which imposes relations between the various partial derivatives of a multivariable function. The function is often thought of as an "unknown" to be solved for, similarly to how x is thought of as an unknown number, to be solved for, in an algebraic equation like $x^2 - 3x + 2 = 0$.

In mathematics and physics, the heat equation is a certain partial differential equation. It was first developed by Joseph Fourier in 1822 for the purpose of modeling of how a quantity such as heat diffuses through a given region.. As the prototypical parabolic partial differential equation, the heat equation is among the most widely studied topics in pure mathematics, and its analysis is ...
