Protein Protein Interactions A Molecular

Protein-protein interactions (PPIs) are the physical contacts of high specificity established between two or more protein molecules as a result of biochemical events steered by interactions that include electrostatic forces, hydrogen bonding and the hydrophobic effect. Many are physical contacts with molecular associations between chains that occur in a cell or in a living organism in a specific biomolecular context.

Protein-protein interaction - Wikipedia

Understanding how biomolecules interact with each other is central to the life sciences. The complexity thereof ranges from specific binary interactions, such as between antibodies and antigens, 1-3 to the formation of complex macromolecular machines. 4, 5 Conversely, undesired interactions are often associated with disease, such as the formation of protein aggregates in neurodegenerative ...

Dynamic modulation of protein-protein interactions provides the physical basis for many biological signaling networks. Consequently, over the last several decades, much effort has been invested in defining and understanding these interactions. Knowledge of the pattern and regulation of discrete protein-protein interactions, and the larger networks that are built from them, tells us how living organisms function as homeostatic entities in the face of a changing environment and also how ...

In molecular biology, an interactome is the whole set of molecular interactions in a particular cell.The term specifically refers to physical interactions among molecules (such as those among proteins, also known as protein-protein interactions, PPIs; or between small molecules and proteins) but can also describe sets of indirect interactions among genes (genetic interactions).

Interactome - Wikipedia

Protein-Protein Interaction. PPIs are crucial to the formation of macromolecular structures and enzymatic complexes that form the basis of nearly every cellular process ranging from signal transduction and cellular transport to catalysing metabolic reactions, activating or inhibiting other proteins and biomolecular synthesis.

Protein interactions are fundamentally characterized as stable or transient, and both types of interactions can be either strong or weak. Stable interactions are those associated with proteins that are purified as multi-subunit complexes, and the subunits of these complexes can be identical or different.
