Vacuum arc remelting - Wikipedia

In steel: Vacuum arc remelting (VAR) In this process, employed for casting steels that contain easily oxidized alloying elements, a consumable electrode made of forged steel or of compacted powder or sponge is continuously melted by an arc under vacuum. At the same time, the shallow molten... [Read More](#)

Vacuum Arc Remelting Furnaces - Consarc

Vacuum arc remelting is a casting process where a consumable electrode is melted under vacuum at a carefully controlled rate using heat generated by an electric arc struck between the electrode and the ingot. Exposure of the molten metal to the low, near-vacuum

The main purpose of the remelting process is to clean the steel. In short: in the ESR process all oxidic particles are absorbed by the slag when the metal drops pass through the remelting slag. Apart from the deposition of macroscopic inclusions, the microscopic cleanliness is also significantly improved.
